

# THE MYSTERIOUS ROCK WALL CONSTRUCTION STORY

There has been a great deal of discussion on ancient construction with rock. These examples are from the internet to illustrate the magnitude. All items are being used with no commercial benefit to the Writer as are all articles in my blog.

**Montana** – Deep in Montana’s remote wilderness lies the Sage Wall, a stunning megalithic structure composed of massive granite blocks intricately stacked in a straight line extending 275 feet (84 meters). Reaching up to 25 feet (8 meters) high, with some blocks weighing 91 tons, it is believed that

the wall continues an additional 15 feet underground. This unique formation appears to have precise, interlocking stones resembling ancient masonry found worldwide.

## History of Stonehenge

Stonehenge is perhaps the world’s most famous prehistoric monument. It was built in several stages: the first monument was an early henge monument, built

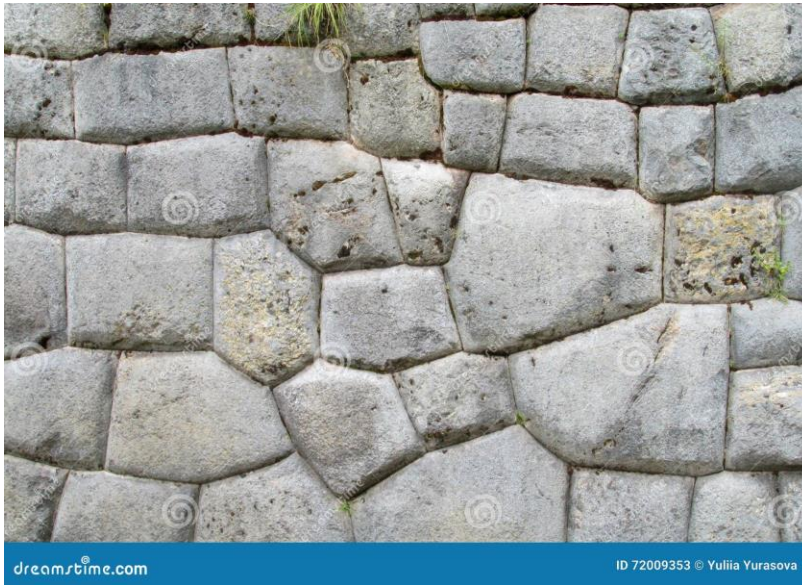

about 5,000 years ago, and the unique stone circle was erected in the late Neolithic period about 2500 BC. In the early Bronze Age, many burial mounds were built nearby.

Today, together with Avebury, Stonehenge forms the heart of a World Heritage Site, with a unique concentration of prehistoric monuments.

Researchers state that *from the scale depicted by the human figures, these megaliths are much larger (as much as 2 to 3 times larger) than the largest known megaliths in the world. Preliminary studies suggest that there are blocks of stone at **Gornaya Shoria** which weigh around three to four thousand tons.*

An incredible discovery that was recently made in Russia threatens to shatter conventional theories about the history of the planet.

On **Mount Shoria in southern Siberia**, researchers have found a massive wall of granite stones. Some of these gigantic granite stones are estimated to weigh more than 3,000 tons, many of them were cut “with flat surfaces, right angles, and sharp corners”.

Nothing of this magnitude has ever been discovered before. The largest stone found at the megalithic ruins at Baalbek, Lebanon is less than 1,500 tons. So how in the world did someone cut 3,000-ton granite stones with extreme precision, transport them up the side of a mountain and stack them 40 meters high?

According to the commonly accepted version of history, it would be impossible for ancient humans with very limited technology to accomplish such a thing.

The Massive Megalithic Limestone Blocks At **Baalbek In Lebanon**: More Ancient Advanced Civilization Evidence

The stones on average weigh 800 tons and are from a quarry about 1 mile away.

**Easter Island**, also known as Rapa Nui, is an island in the Pacific famous for the massive humanoid statues peppered along its coasts. These *moai* are commonly called stone heads, but actually most possess bodies, and the largest constructed stands at over 30 feet and weighs 82 tons. Ever since these monoliths were encountered by European

explorers in the 18th century, the history of the island has been a topic of fascination and debate. Most captivating is the mystery of how almost 900 *moai* were carved and transported, mostly between 1250 CE and 1500 CE, only to be toppled and abandoned by the 18th century.

The history remains contentious, and its scholarship is currently hosting a fierce debate between two rival camps. The first account, popularised by Jared Diamond in his bestselling book *Collapse* (2005), presents the island's history as a cautionary tale of the destructive potential of humans to overexploit natural resources. A contradictory account has been advocated over the past decade by a group of scholars, led by the anthropologists Carl Lipo and Terry Hunt, who contend that the 'collapse' Diamond describes is largely a European myth. Instead, *continuity* is the hallmark of settlement on Rapa Nui.

Massive stone walls, Ggantija Temple, near **Xaghra, Gozo, Malta.**

Nan Madol was the ceremonial and political seat of the [Saudeleur Dynasty](#), which united Pohnpei's estimated population of 25,000 people until about 1628.<sup>[3]</sup> Set apart between the main island of Pohnpei and [Temwen Island](#), it was a scene of human activity as early as the first or second century AD. By the 8th or 9th century, islet construction had started, with construction of the distinctive [megalithic](#)

[architecture](#) beginning 1180–1200 AD.<sup>[15]</sup>

Polish ethnographer and oceanographer [John Stanislaw Kubary](#) made the first detailed description of **Nan Madol** in 1874.<sup>[16]</sup>

Little can be verified about the megalithic construction. Pohnpei an tradition claims that the builders of the [Leluh archaeological site](#) on [Kosrae](#) (likewise composed of huge stone buildings) migrated to Pohnpei, where they used their skills and experience to build the even more impressive Nan Madol complex. [Radiocarbon dating](#) indicates that Nan Madol predates Leluh; thus, it is more likely that Nan Madol influenced Leluh.

There are many more examples and evidence of superior skills, intelligence and ingenuity of those who created these mammoth projects. I did not include the pyramids in Egypt, China, and Mexico but I find them amazing examples of Engineering and orientation to the constellation Orion as depicted in this image.

That is an astronomical coincidence or an objective of the Builders.

There have been many theories as to how this

was achieved and by whom but there is not a credible conclusion.

Perhaps it was technology that came from Outer Space, but I have another unprofessional theory to add to all the others.

I have always wondered about our human body and the cell structure of our brain. This was taken from the internet:

## ***“..... What Percentage of Our Brain Do We Use? 100%? 10%?”***

*This entry was posted on [September 13, 2022](#) by [Anne Helmenstine](#) (updated on [February 20, 2024](#))*

*the idea that human brains employ “sparseness” in their firing behavior makes a lot of sense. Over time, all of the neurons fire, but only a few are active at any time. This sparse behavior makes optimal use of limited blood flow (oxygen and nutrients) and simplifies a highly complex system. Some estimates place the number of active neurons at any instant to around 20 percent (other as low as 10 percent and as high as 50 percent).*

*The bottom line: You use 100% of your brain, but you use closer to 10% of your brain at any moment in time.....”*

It is possible then that we could use 100% of our brain more often. What would happen then? Is it possible that there has been times when the human population did achieve that objective and then were able to accomplish these projects.

Animals mostly forage when they are hungry and then rest. Perhaps humans are similar in that we only rise to an occasion when we are stimulated to do so.

Many Archaeologists and Historians suggest that these structures were not constructed by humans but perhaps by alien intelligence.

What do you think?
